                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Percent Similarity:
                                                                                                           The invention relates to a DNA sequence located in a promoter of a secretable protein, where the DNA sequence mediates transcriptional down-regulation of secreted proteins under secretion stress. The DNA sequence, promoter or the fungal host is useful to optimize protein production. The methods are useful to or to modify fungal strains for other purposes and selectively regulate the expression of certain undesired or desired proteins in the host. The present sequence represents a T. reesei DNA fragment located upstream of the cbhl gene promoter. The promoters of the invention are modified such that they lack the present sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT 30
AAS83866/c
                                                                                                                                                CC The invention relates to isolated polynucleotide (I) and CC polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CPC polynucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC (II). (II) is useful for generating annibodies against it, detecting or CC (III). (II) is useful for generating annibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical CC imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. CC The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and CC amino acid sequences. AAS64197-AAS94564 represent novel human CC diagnostic coding sequences of the invention.

CC Note: The sequence data for this patent did not appear in the printed CC are fell wino in fully hyphilable for temperature.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     US-10-081-935-2 (1-18)

                                                                                                                                                                                                                                                 The invention relates to a DNA sequence located in a promoter of a secretable protein, where the DNA sequence mediates transcriptional down-regulation of secreted proteins under secretion stress. The DNA sequence, promoter or the fungal host is useful to optimize protein production. The methods are useful to or to modify fungal strains for other purposes and selectively regulate the expression of certain undesired or desired proteins in the host. The present sequence represents a T. reesei DNA fragment located upstream of the cbh1 gene promoter.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a DNA sequence located in a promoter of a secretable protein, where the DNA sequence mediates transcriptional down-regulation of secreted proceins under secretion stress. The DNA sequence, promoter or the fungal host is useful to optimize protein production. The methods are useful to or to modify fungal strains for other purposes and selectively regulate the expression of certain undesired or desired proteins in the host. The present sequence represents a T. reesei DNA fragment located upstream of the cobil gene promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pakula T,

The DNA sequence, promoter or the fungal host is useful to optimize protein production. The methods are useful to or to modify fungal strains for other purposes and selectively regulate the expression of certain undesired or desired proteins in the host. The present sequence represents a T. reesei DNA fragment located upstream of the cbhl gene promoter.
                                                                                                              22-AUG-2002

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           US-10-081-935-2 (1-18)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a DNA sequence located in a promoter of a secretable protein, where the DNA sequence mediates transcriptional down-regulation of secreted proteins under secretion stress. The DNA sequence, promoter or the fungal host is useful to optimize protein production. The methods are useful to or to modify fungal strains for other purposes and selectively regulate the expression of certain undesired or desired proteins in the host. The present sequence represents a T. reesei DNA fragment located upstream of the cobil gene promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI;
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent

                 The invention relates to a DNA sequence located in a promoter of a secretable protein, where the DNA sequence mediates transcriptional down-regulation of secreted proteins under secretion stress. The DNA sequence, promoter or the fungal host is useful to optimize protein production. The methods are useful to or to modify fungal strains for other purposes and selectively regulate the expression of certain undesired or desired proteins in the host. The present sequence represents a T. reesei DNA fragment located upstream of the cobhl gene promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Local

pMLO16del0(2) was used as a PCR template to yield a 280 bp fragment E (primers = AAQ58023 and AAQ58024), beginning at the promoter internal polylinker and ending at -720, and a 720 bp fragment F (primers = AAQ58026 and AAQ58028), beginning at -720 and ending at KspI at -16. Fragments D and E were purified from agarose gel and digested with BstEII-XbaI and XbaI-KspI respectively,& ligated to the 7.8 kb BstEII-XspI fragment of pMI-25 to produce produce

Fragments G and H were purified from agarose gel and digested with BatEII XbaI and XbaI-Kspl respectively, & ligated to the 7.8 kb BstEII XbaI fragment of pM1-25 to produce produce pM1-28. The cbh1 promoter of pM1-28 has sequence alterations at posns. -1505-1500 (genomic sequence GTGGGG, altered sequence TCTAAA), -1001-996 (genomic sequence CTGGGG, altered sequence TCTAAA), and at posn, -720 to -715 (genomic sequence GTGGGG, altered sequence CTGTGGA) upstream of the translation initiation codon of intact cbh1 promoter. The sequence of the altred cbh1 promoter in pMI-28

                    The invention relates to a DNA sequence located in a promoter of a secretable protein, where the DNA sequence mediates transcriptional down-regulation of secreted proteins under secretion stress. The DNA sequence, promoter or the fungal host is useful to optimize protein production. The methods are useful to or to modify fungal strains for other purposes and selectively regulate the expression of certain undesired or desired proteins in the host. The present sequence represents a T. reesei DNA fragment located upstream of the cbhl gene promoter.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Description

The cDNA library to be analyzed within the framework of this project was created using a Botrytis cinera strain which was grown under conditions of nitrogen deprivation, which is the normal situation for B. cinerae during its development on its host plant. The library was produced in an oriented direction, in the pBSII
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             BOLTYLIS cinerea strain T4 cDNA library under conditions of nitrogen deprivation.
                                                                                                                                                                              Eukaryota; Fungi; Ascomycota, Pezizomycotina; Leotiomycetes; Helotiales; Sclerotiniaceae; Botryotinia.

The cDNA library to be analyzed within the framework of this project was created using a Botrytis cinerea strain which was grown under conditions of nitrogen deprivation, which is the normal situation for B. cinerea during its development on its host plant.

The library was produced in an oriented direction, in the pBSII
                                                                                                                                                                                                                                                                                                                                                                                       PLN 02-SEP-1999

The CDNA library to be analyzed within the framework of this project was created using a Botrytis cinerae strain which was grown under conditions of nitrogen deprivation, which is the normal situation for B. cinerae during its development on its host plant. The library was produced in an oriented direction, in the pBSII
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               696 bp mRNA linear PLN 03-SEP-1999 strain T4 cDNA library under conditions of

The cDNA library to be analyzed within the framework of this project was created using a Botrytis cinerea strain which was grown under conditions of nitrogen deprivation, which is the normal situation for B. cinerea during its development on its host plant. The library was produced in an oriented direction, in the pBSII
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PLN 02-SEP-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Submitted (01-SEP-1999) Genoscope - Centre National de Sequencage :

The cDNA library to be analyzed within the framework of this project was created using a Botrytis cinerea strain which was grown under conditions of nitrogen deprivation, which is the normal situation for B. cinerea during its development on its host plant.
The library was produced in an oriented direction, in the pBSII
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Borrace Strain T4 cDNA library under conditions of AL113187
    The library was produced in an oriented direction, in the pBSII
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Eukaryota; Fungi; Ascomycota; Pezizomycotina; Leotiomycetes; Helotiales; Sclerotiniaceae; Botryotinia.

The CDNA library to be analyzed within the framework of this project was created using a Botrytis cinerea strain which was grown under conditions of nitrogen deprivation, which is the normal situation for B. cinerea during its development on its host plant.
                                                    Eukaryota; Fungi; Ascomycota, Pezizomycotina, Leotiomycetes, Helotiales; Sclerotiniaceae; Botryotinia.

* NOTE: This is a 'working draft' sequence. It currently
* consists of 3 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* truns of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
* as soon as it is available and the accession number will
                                                                           ACLISU471

Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Contact: sequence_submissions@genome.wi.mit.edu

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   been renumbered from the original cosmid submissions but the old gene designations are in brackets after the new gene numbers. Gene prediction was based on a Hidden Markow Model of TB genes implemented in TBparse (Krogh) supplemented with visual inspection of positional base preference in codons, especially where there is an increase in the observed/expected third position G + C. CAUTION: In some cases we may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg, gtg, or ttg) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Direct Submission

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ien: 373 aa, from Mycobacterium tuberculosis strain H37RV, (100.0% identity in 373 aa overlap). Probable citA (alternate gene name: glth), citrate synthase 2 (EC 4.1.3.7), highly similar to others e.g. CAB95899.1|AL359988 putative citrate synthase from Streptomyces coelicolor (387 aa); P39119|CISY BACSU citrate synthase II from Bacillus subbilis (366 aa), FASTA scores: opt: 586, E(): 5.0e-30, (33.0% identity in 367 aa overlap); etc. Also similar to Rv0896|MT031.24 from Mycobacterium tuberculosis (29.3% identity in 274 aa overlap) and Rv1131. Contains P500480 Citrate synthase
